

# Direct Anterior restoration

Meena Essam

# Case presentation

25 years male patient presented to my clinic with very shy smile not willing to show his teeth due to multiple carries lesions in his anterior teeth with discolored left central incisor. Patient seeking an esthetic treatment to enhance his smile with minimal preparation for his teeth to be able to smile again with confident, so direct veneers was the best choice to give the best esthetic result for him.

# Treatment plan

First re-endodontic treatment for left central incisor to be ready for internal bleaching, then 4 sessions of internal bleaching for the same tooth to reach same shade of other teeth. After that we started to do the planned direct restorations for the 6 anterior teeth with natural shade and shape.

Initial smile presenting multiple carries and discoloration

Close up view showing carries lesions, old restorations and discolored tooth

After 4 sessions of internal bleaching

After removing all carries and old restoration now teeth are ready for layering composite restoration

Using layering technique to make direct veneers by using OA2 as dentin shade with WE as a final layer

Completing all teeth with  
direct restoration with final  
characterization using  
layering technique  
Shade are used is OA2,WE

Showing the natural  
morphology that was  
restored to teeth

Final result showing the enhancement of patient smile after one month recall, patient smile widely with more confident

Final result, close up view

Another close up intraoral view

Before and after showing the power of minimal  
invasive restoration to enhance a smile

Texture and details

# conclusion

Using minimal invasive approach can enhance a smile and give a great esthetic result by understanding the properties, shades and opacities of composite to mimic nature.
